NZ Imagery Surveys

Date**Date****Abstract**

The NZ Imagery Surveys dataset contains a comprehensive index of all orthophoto index tiles found on the LINZ Data Service. Each record in the dataset provides both a geometry of the maximum extent of the orthophoto index, as well as all attributes found in each index tile. This dataset therefore provides information to assess orthophoto coverage and metadata across the entire country. Please refer to the [NZ Imagery Surveys Data Dictionary](https://nz-imagery-surveys.readthedocs.io/en/latest/published_data.html) for detailed metadata and information about this layer.

Purpose

Orthoimagery available on the LINZ Data Service is a result of many different aerial flights spanning many different regions, flown over multiple years, and at different resolutions. As a result, each set of orthoimagery has an index tile dataset which contains metadata specific for that dataset. The NZ Imagery Surveys data described

here provides a single source for all currently available orthoimagery index tiles available on the LDS.

Statement

The nz_imagery_surveys dataset is an aggregation of all the index tiles layers on the LDS. The inner boundaries of each index tiles layer have been dissolved. The dissolved layer is clipped by the corresponding imagery to get the actual edge of the survey extent. However, for some imagery there are white pixels (RGB 0, 0, 0) along the edge, and since 'no data' is also set to (RGB 0, 0, 0), there is no way to differentiate white pixels from 'no data' pixels. In these situations manual editing is involved in clipping and the resulting edge is approximate. The attribute tables of the index tiles layers are standardised and imported into the nz_imagery_surveys dataset.
